

**Lighting cold represent  
15 % of energy  
consumption, or a cost of  
75 euros per year.**

#### **REMINDER**

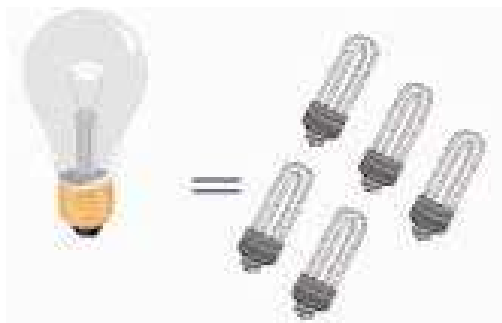

Some household appliances need more energy in sleep mode than in use. For instance the video recorder, the TV set or the hi fi system. These sleep modes are a useless energy consumption going up to 900 kw per year. Plunging it in a power strip with a switch button is a good way to save money !

**How to reduce that cost? By following these few tips ...**

- 1 – Switch on the light only when daylight is not enough.
- 2 – Don't forget to switch off the light when you leave a room.
- 3 – Adjust bulb power according to the room. It's useless to put a 100 W bulb in a room which just needs a 60 W one.
- 4 – Use few or no halogen lamps at all. They're big energy consumers.
- 5 – In rooms where the lights are on for a long time, choose low consumption bulbs.

**It takes 5 times less energy for the same brightness and  
lasts 8 to 10 times longer.**

**ADVISING NOTICE FOR ENERGY SAVING**

All these tips can

**Reduce by 50 %**

**your energy consumption for  
lighting,  
or a possible save of**

**35.50 euros per year.**
